

a From a slotted beam to a crack graph

Slot 1: magnified section

Length: 254.8 mm
White = initial cavity

b Geometry, prescribed exposure and scalar prediction

GNN transfer tests: same trained weights → unseen N / radius / symmetric kNN views

c Actual archival reference from the same three-slot case

1 Native scalar $r(i)$ → 2 Running minimum $e(i)$ → 3 Reference $y(k)$, $k = 0, \dots, 60$

$e(i) = \min[r(0), \dots, r(i)]$; $y(k)$ = linear interpolation of e at $t = 60k$ s
